

QAtrain™

QAtrain™ is a tool for keeping track of training activities.

QAtrain™ can be used as an independent product, interfacing only with QAtor support modules providing notifications, storage, login, logging facilities etc. QAtrain™ can also work in conjunction with other QAtor products such as QAcii™, QACHange™ or other QAtor suite products.

QAtrain™ will give the user the following advantages:

- Pre-defined training programs
- Scheduled re-training with notifications
- Update of training when documentation alters
- Registration of non-company native training material/written procedures
- Retention of training documentation
- Traceability of an employees training status for a given period
- Internal courses with a booking system
- Support for trainers

Used in conjunction with other QAtor products give the users the following advantages:

- QACHange™ : Automatic generation of deviations when training does not fulfill the pre-defined expectations
- QAcii™ : Definition of required training in relation to equipment
- QAcii™ : Request for re-training when equipment alters
- QAbinder™ : Non native documents are stored for safe keeping

The QAtrain™ tool is like all Qator applications web based and meets the requirements expected in the pharmaceutical industry (GxP, FDA requirements in general, Eudralex etc.). The system secures traceability in the entire process.

The system fulfills the FDA 21 CFR part 11 requirements regarding signatures and audit trails as well as EEC annex 11 cGxP standards. Data stored in QAtrain™ (or links to data on GxP drives) must be filed in a database and subject to full audit trail logging and access control.

Functional overview of QAtrain™:
